Mentor: Paramita Chakravarty

Project Title: Smart Internship Management Portal

1 Introduction

During my 1st week of internship I was involved in the development of a Smart Internship Management Portal. The main idea for this project was to build a simple and efficient platform where the internship related activities can be managed in one place.

Most organizations use spreadsheets, emails, or messages to keep track of intern attendance, daily work updates, feedback, and progress reports. This can be difficult to keep up with and track properly.

With this project I tried to create a centralized web application where the interns can submit their daily work, mark attendance and mentors can keep track of their progress and provide feedback.

2. Problem Statement

Manually managing interns is time consuming as the data is stored in different places and it becomes difficult to track every intern's performance.

The objective of this project was to design and develop a Smart Internship Management Portal that provides an easy way to manage intern details, daily submissions, attendance records, mentor feedback, and performance reports.

3. Project Goals

The main aims of my project were to:

To Design a simple and user friendly internship management system.

To provide different user roles like Admin, Mentor and Intern.

To enable interns to submit daily work reports.

To implement attendance tracking functionality.

To enable feedback from mentors.

To create a dashboard to monitor internship progress.

To produce performance reports.

4. Technologies Utilized

Technologies used to develop this project:

Frontend:

Used to build the structure of web pages.

CSS: .

Used in designing and improving the look of the website.

JavaScript:

To add functionality and connect the front end with back end apis.

Backend:

Node.js:

Used to setup the backend environment .

Express.js:

Used to develop APIs and manage requests between frontend and backend.

Tools for Development:

Visual Studio Code , Web Browser , Node Package Manager NPM ,

Database :MongoDB Atlas Used as a cloud database to store user details, daily reports, attendance records, and mentor feedback data.

5. Architecture of the Project

The project is based on the client-server architecture.

The frontend handles the UI and interaction with the user.

The backend handles the application logic, handles requests, processes data and sends responses.

The application has different modules for users, reports, attendance, feedback and dashboard statistics.

6. Implemented features

6.1 User Login and Role Selection

I made a login/register page where users can enter their details and choose their role.

Open positions:

Admin , Intern , Mentor

After successful login, the user will be taken to the dashboard.

The screenshot shows a web browser window with the URL `127.0.0.1:5500/SMART-INTERSHIP-MANAGEMENT-PORTAL/frontend/index.html`. The page features a central white login/register form with the following elements:

- mindlabz** logo in orange, with "Hospitality Services Pvt. Ltd." in smaller text below it.
- Internship Management Portal** title in bold black text.
- Input fields for: Name (containing "Khushi Mehta"), Email (containing "kmehta160206@gmail.com"), Password (masked with "*****"), and Role (a dropdown menu currently showing "Intern").
- An orange button labeled "Login / Register".

This image is a close-up of the role selection dropdown menu. It shows a list of three options: "Intern", "Mentor", and "Admin". The "Intern" option is currently selected and highlighted with a dark grey background.

Intern
Mentor
Admin

6.2 Dashboard Module

The dashboard provides an overview of the internship activities.

It indicates:

User Count

Reports submitted

Attendance logs

Logs of feedback

The screenshot displays the 'Internship Management Dashboard' for a user named Khushi Mehta (Intern). The dashboard is branded with 'mindlabz Hospitality Services Pvt. Ltd.' and features a clean, modern design with orange and white color accents.

Dashboard Statistics:

- Users: 3
- Reports: 0
- Attendance: 0
- Feedback: 0

Submit Daily Work Report:

Task Title:

Work Done Today:

Submit Report

Mark Attendance:

Present:

Mark Attendance

Mentor Feedback:

Feedback Comment:

Rating out of 5:

Add Feedback

Submitted Reports

Generate Final Report

6.3 Daily Work Report Submission

This feature allows interns to submit their daily work updates.

The intern can enter:

- Task title
- Work completed
- Date
- Submission status

This replaces manual daily reporting methods.

The screenshot shows a web form titled "Submit Daily Work Report" in orange text. It contains two text input fields. The first field has the text "smart internship project". The second field contains two lines of text: "Developed authentication module" and "Created dashboard UI". Below the input fields is a wide orange button labeled "Submit Report".

6.4 Attendance Management

I added an attendance module where intern attendance can be marked and tracked. The system stores attendance status such as Present or Absent.

The screenshot shows a web form titled "Mark Attendance" in orange text. It features a dropdown menu with "Present" selected. Below the dropdown is a table with two rows. The first row has "Present" in the first column and an empty cell in the second column. The second row has "Absent" in the first column and an empty cell in the second column.

6.5 Mentor Feedback Module

This module will allow mentors to provide feedback for the work done by interns.

The feedback contains:

- Mentor name
- Comments
- Rating

This helps in performance evaluation of the interns.

The image shows a UI for the 'Mentor Feedback' module. It features a title 'Mentor Feedback' in orange. Below the title is a large text input field labeled 'Feedback Comment'. Underneath that is a smaller input field labeled 'Rating out of 5'. At the bottom is a wide orange button labeled 'Add Feedback'.

6.6 Report Generation

I implemented a report generation feature where internship details can be exported.

The generated report contains important internship progress details.

The image shows a UI for 'Submitted Reports'. It has a title 'Submitted Reports' in orange. Below the title is a light gray box containing the following text: 'smart internship project', 'Intern: Khushi Mehta', 'Date: 2026-06-05', 'Work: Developed authentication module Created dashboard UI', and 'Status: Submitted'. At the bottom is a wide orange button labeled 'Generate Final Report'.

7. Implementation Details

I first created the frontend pages using HTML and CSS.

After completing the basic structure, I created the backend server using Node.js and Express.js.

Different API endpoints were created for:

- User registration
- Report submission
- Attendance management
- Feedback submission
- Dashboard statistics

MongoDB was integrated with the backend using Mongoose to provide permanent data storage and manage application records efficiently.

The frontend here communicates with the backend using JavaScript fetched API.

8. Testing

After implementation, I tested all major functionalities.

Test cases performed:

1. Registered a new user successfully.
2. Submitted daily work reports.
3. Checked attendance marking functionality.
4. Added mentor feedback.

5. Generated internship performance report.

All modules worked according to the expected requirements.

9. Challenges Faced

Since this was my first web-based project for an IT company, I faced challenges while connecting frontend and backend components as I was not that much aware of backend but I learnt some of the backend basics in the meanwhile and fulfilled the requirements.

I learned about API creation, server handling, routing, and how different modules of a real application communicate with each other.

Another challenge was completing the project within a limited development timeline.

I focused first on completing the core functionalities such as user management, daily report submission, attendance tracking, mentor feedback, dashboard statistics, and report generation.

This helped me understand how to prioritize important features while building a working software solution within a given deadline.

The project can be further improved by adding more advanced features and database deployment in future versions.

10. Future Enhancements

In future versions, I would like to add:

- Advanced database optimization and data analytics features.
- Advanced admin panel.
- Email notifications.
- File upload option for interns.
- Graph-based analytics.

11. Conclusion

The Smart Internship Management Portal successfully provides a centralized system for managing internship activities.

Through this project, I gained practical experience in full-stack development and understood how frontend and backend systems work together to create a complete application.

This project helped me improve my understanding of web development and real-world software development practices.
